# FOREIGN CROPS AND MARKETS AND

# ISSUED WEEKLY BY THE FOREIGN AGRICULTURAL SERVICE BUREAU OF AGRICULTURAL ECONOMICS UNITED STATES DEPARTMENT OF AGRICULTURE

WASHINGTON, D.C.

Vol. 27

OCTOBER 9, 1933

No. 15

#### FEATURE ARTICLE

UNITED STATES AGRICULTURAL EXPORTS, 1932-33

#### IN THIS ISSUE

LATE CABLES	Page 390
French wheat carry-over large	392
English wheats of variable quality; crop larger	393
Russian harvest and fall sowings ahead of last year	394
Argentine crop outlook affected by grasshoppers	395
Japan has another large rice crop	396
Egyptian cotton crop shows sharp increase	396
South African sheep numbers decreased by drought	398
French fruit import quota reduced	398
Russian agricultural exports decline	399

#### LATE CABLES

Japan rough rice area for 1933 is forecast at 7,867,000 acres as against 7,983,000 acres in 1932. Production is estimated at 10,317,000 short tons as compared with 9,486,000 short tons in 1932. See statement page 396 and table page 424. (International Institute of Agriculture, Rome, October 6, 1933.)

China Cotton Statistical Association now estimates Chinese cotton crop at 2,744,000 bales of 478 lbs. This is an 8 percent decrease from the August 1 estimate and compares with the estimate by this office of 2,600,000 bales or 15 percent above last year's crop. (Agricultural Commissioner O. L. Dawson, Shanghai, October 4, 1933.)

German weather generally dry throughout September. Crop condition of late potatoes slightly above average, while the sugar beet crop appears only average. (International Institute of Agriculture, Rome, October 6, 1933.)

Italian rice crop this season officially estimated at 408,940 short tons compared with 446,797 tons a year ago. (International Institute of Agriculture, Rome, October 3, 1933.)

London wool sales closing October 11. Yorkshire has been keen for all greasy crossbreds at firm prices. Germany has taken the bulk of combing merinos, both scoured and greasy at opening rates; French interest was quiet and takings were limited. Withdrawals have been light. (Agricultural Attache Foley, London, October 6.)

#### CROP AND MARKET PROSPECTS

#### BREAD GRAINS

#### Summary of recent bread grain information

The total of official estimates covering 1933 wheat production in 30 countries remains unchanged from 2,626,632,000 bushels reported last week. This is 8.6 per cent below the 1932 outturn of the same countries when they produced about 90 per cent of the wheat grown in the Northern Hemisphere, excluding Russia and China. Rye production in 21 countries, as officially estimated and reported last week, also remains unchanged, the total being 939,742,000 bushels as compared with the 1932 total of 938,756,000 bushels.

World wheat <u>shipments</u> during the last week of September totaled 9,680,000 bushels of which the Northern Hemisphere accounted for 4,378,000 bushels. The Argentine movement declined to 1,281,000 bushels with offerings somewhat firmer and chartering light. The Australian shipments amounted to 2,021,000 and the Russian to 1,040,000 bushels. The present Russian shipments are not alarming nor necessarily indicative of good harvests. Exports for the first three months of this marketing season July-September are placed at only around 6,000,000 bushels compared with nearly 27,000,000 during the same period of the big crop year 1930 and over 42,000,000 bushels during the same time of 1931.

At the recent meeting of the World Wheat Agreement advisory Committee in London (convened September 18) there were several developments of an encouraging nature. One was a statement by the German representative outlining a new policy of that Government which contemplates a reduction in the acreage sown to wheat in Germany. This appears especially significant when it is considered that Germany has increased its wheat acreage relatively more than nearly any other country in Europe and that it has heretofore pursued a policy looking toward a continued expansion of wheat production. At the same time the representative of France stated the French government was putting into effect a regulation lowering the percentages of extraction of wheat flour from wheat. This is in line with that part of the agreement which states that each country should take steps to increase wheat consumption.

#### Foreign market conditions

#### China (Shanghai)

Continued low flour prices, heavy wheat arrivals at Shanghai, extreme pessimism of the trade, and uncertainty as to the future market have necessitated a reduction in the early estimate of wheat imports into China for 1933-34 made by the Foreign Agricultural Service office at Shanghai, according to a radio message of September 29. The present estimate is placed at something between

#### CROP AND MARKET PROSPECTS, CONT'D

22,000,000 to 27,000,000 bushels for foreign wheat, including arrivals since July 1 of 3, 038,000 bushels; this compares with the previous estimate of 27,000,000 to 33,000,000 bushels. Estimated imports for flour into China, however, remain at 1,361,000 barrels of 196 pounds, while it was thought that about 2,000,000 barrels would go to Manchuria, which includes Japanese and other foreign flour but excludes that from Shanghai. The total of Shanghai arrivals of native wheat up to mid-September last season has been corrected to 5,500,000 rather than 3,300,000 bushels as reported last week and compares with over 13,300,000 bushels received during the corresponding period this year.

For <u>Tientsin</u>, the flour requirements were expected to decline somewhat this season due to better wheat crops. Last season Tientsin imported 4,929,000 barrels of flour.

#### Japan

In view of the large Japanese wheat crop and the restricted market for flour in North China, it is believed by the Bureau's Shanghai Office that Japan will not use more than 12,000,000 to 15,000,000 bushels of foreign wheat this year.

#### Large wheat carry-over in France

Wheat and flour stocks in France on August 1, 1933 which were carried over from last year's supplies were officially reported at 57,059,000 bushels according to the Marseille office of the Foreign Agricultural Service. Over three fourths of this amount was in the form of wheat as grain with a substantial portion still in farmers hands. See table below.

This census of wheat and flour stocks was carried out in accordance with the law of July 10, 1933, which required declaration of stocks as of July 31 this year from everybody possessing more than 367 bushels of wheat or flour on that date, including the quantities being shipped on railroad, trucks and waterways. When considering, however, that many of the numerous small farmers who might have had less than the stated amount of 1932 crop wheat or flour on hand on July 31 did not make a declaration and also that inferior flour not suitable for baking purposes was not included in the census together with some fraudulent declarations, the figure of 57,059,000 bushels is believed to be somewhat lower than the actual carry-over.

Accepting the official figure for consumption in the 1932-33 season which was placed at 320,586,000 bushels, the 1932 crop production on the basis of the present carry-over should have been about 378,000,000 bushels instead of 333,524,000 bushels as reported. The Bulletin des Halles placed the 1932 crop at 385,805,000 bushels and the carry-over into the 1933-34 season at 64,300,000 bushels. The official estimate for the present crop is 338,663,000 bushels and the Bulletin des Halles estimates 363,686,000 bushels.

#### CROP AND MARKET PROSPECTS, CONT'D

French wheat and flour stocks, August 1, 1933

Item	Wheat	Flour suitable for baking purposes
	Bushels	Barrels (196 lbs)
In Farmers hands In mills Stored by trade & others	20,998,000 12,735,000 10,049,000	7,879 1,117,186 1,922,943
TOTAL		3,048,008 or 13,275,000 bu. in terms of wheat

Journal Official, September 10, 1933.

#### English wheats of variable quality; crop larger

According to reports from milling trade sources the quality of the 1933 crop of English wheat is quite variable, states J. H. Shollenberger, grain specialist at Berlin. Some of this season's wheats yield flour of a clay-like consistency and of very poor baking quality. On the other hand, some are of exceptionally good quality and give extremely good results both in milling and in baking.

The moisture content of English wheats this year is much lower than usual. Some millers state that not since 1921 has there been a season in which the wheats have been as dry as those of this year's crop. Many of the wheats tested thus far have shown moisture contents of not more than 13 per cent.

It is reported that in the Eastern counties there was a fair amount of field damage consisting of blighted wheat, but generally taking the country as a whole field damage was comparatively light. The 1933 wheat crop in England and Wales is estimated at 57,008,000 bushels compared with 41,253,000 last year and 35,896,000 bushels 2 years ago.

#### FEED GRAINS

#### North African malting barley taken by France

Up to the present time, all malting barley of the 1933 crop exported from Morocco has been shipped to France, according to a report from the Marseille office. Since January 1, 1933, the quantity of foreign barley imported into France has been restricted by quotas in order to improve the domestic prices or to maintain them at a level remunerative to French

#### CROP AND MARKET PROSPECTS, CONT D

barley growers. Moroccan barley, however, can enter France free of duty, within the limits of a contingent fixed provisionally by the French government at 2,958,000 bushels.

The 1933-34 barley crop of Algeria leaves much to be desired in the way of quality, with little available of malting quality. The crop was affected by dry winds at the most critical stage of its growth. In both Algeria and Tunisia, the specific weight is low, and it is believed that what little malting barley is available for export will go to France, where it can enter free of duty.

#### Russian harvest and fall sowings ahead of last year

An area of 181,000,000 acres or about 87 per cent of the total area sown to cereals was harvested by September 5. On the same date last year, the harvested area constituted 165,000,000 acres. While the southern regions have practically completed the cutting of grain, the northern and eastern regions, still have to cut a considerable proportion of the acreage. The harvest is particularly behind in the important Ural region where only a little over 50 per cent of the area was cut by September 5. In western Siberia 79 per cent of the area was cut by that date. In both of these regions the harvest normally should end by the middle of September. A considerable disparity between cutting, stacking and threshing in all regions, observed earlier in the season, has continued. On September 5 only 43 per cent of the area harvested was threshed. As a result there is a danger of considerable losses of the grain lying in the fields unstacked.

An area of 36,959,000 acres was sown to winter crops by September 5, 1933 constituting 39.3 per cent of the plan. The area sown on the same date last year was 27,384,000 acres. The official reports have continued to show a wide disparity between the considerable advance made in the sowings in the northern regions and the lagging sowing in the southern regions. See "Foreign Crops and Markets" September 18, 1933, page 288. Thus while in the Leningrad region, 98 per cent and in the Moscow region, 68 per cent of the acreage planned was sown by September 5, in such important winter wheat regions as North Caucasus and Ukraine less than 1 per cent and 11 per cent, respectively, of the area planned was sown on that date. These two regions account for nearly 70 per cent of the winter wheat acreage planned for this season. Commenting editorially on this situation, the Moscow newspaper Pravda of September 14 explains the lagging sowings in the southern regions by the small fallow area and the delay in the harvesting of cultivated crops which precede the winter crops and in the preparation of the soil for the latter.

#### CROP AND MARKET PROSPECTS, CONTID

#### Grasshoppers now factor in Argentine crop outlook

Now that the possibility of damage to the wheat and flaxseed crops from the drought has been effectively removed, for the time being at least, by the heavy rainfall of early September more attention is directed toward the present situation and future possibility of crop injury from the grasshopper plague, states Assistant Agricultural Commissioner Charles Luedtke at Buenos Aires. As indicated in previous reports, the grasshopper invasion now covers all of the northern provinces of the Republic, including the wheat and flaxseed areas in the provinces of Santa Fe. Cordoba and Entre Rios.

Due to the cool weather provailing during the several weeks immediately preceding the rains and the consequent lack of great activity on the part of the grasshoppers, the possibility of damage from the grasshoppers had become of secondary interest in the crop outlook situation, and it is now generally conceded that little if any further damage to the wheat and flaxseed crops may be expected from this causa. However, the grasshopper is still considered a real potential danger, particularly to the corn crop, to say nothing of the alfalfa fields and fruit orchards. Some Argentine papers point out that the invasions this year have started very much earlier than in former years, are somewhat more intensive, and may reach even greater proportions than last year.

According to Dr. Spangenberg, Director of the Bureau of Agricultural Defense and Plant Quarantine of the Ministry of Agriculture, who was interviewed by Mr. Luedtke recently, the areas invaded as well as the intensity of the movement is considerably less this year than last. The laying of eggs by the grasshoppers in the province of Tucuman and in Parana has already occurred, and with the warm weather coming on the laying of eggs will now continue in other sections of the invaded areas. According to the officials in the Ministry of Agriculture, it will take from forty to fifty days or so before these eggs are hatched. By that time it is believed that the wheat and flaxseed crops will be sufficiently far along to escape damage from the young grasshoppers, but other late crops, particularly corn, will be subject to destructive damage.

The Government is pushing its plans for the control work. The first shipments of the sheet iron to be used for the construction of the barriers are expected to arrive from the United States and England early in October. It is understood that an Executive Decree has already been signed which will provide for the sale of these barriers to the farmers to be repaid in ten years. Purchase by the Government of the "flyers" is continuing, and it is reported a decree now being prepared will authorize the purchase of the grasshopper eggs also. By thus destroying the eggs, which it is said can easily be found in plowing or cultivation operations, it is hoped to materially reduce the future crop of grasshoppers, The officials of the Ministry of Agriculture who are carrying on the control work hope that by cooperation among the farmers and unified action in the erection of the barriers they will

#### CROP AND MARKET PROSPECTS, CONTID

be able to achieve more effective results in preventing the movement of the grasshoppers than was possible with the individual effort made by the farmers themselves last year. The Ministry of Agriculture is also interested in the possibility of the use of flame sprayers for burning the grasshoppers and plans are being made to announce a contest for the submission of such apparatus. The fact that the grasshoppers in the infested areas are often settled in quite inaccessible places, together with the sparse population of the general agricultural regions, is making the control work of the Government exceedingly difficult, it is said.

#### RICE Japan and colonies have another large rice crop

Japanese rice production is privately estimated this year at about 9,975,000 short tons compared to 9,486,000 last year and 9,498,000 the average for the past five years, according to information from Consul General Garrels at Tokyo and forwarded by the Shanghai office of the Foreign Agricultural Service. Chosen is also reported to have a good rice crop with production expected to be about equal to last year when it was 2,568,000 tons. The crop in Formosa (Taiwan) is placed at 61,000 to 175,000 tons below year's record crop of 1,417,000 tons, states Consul Ketchum. See table page 424.

Japanese officials are said to be much concerned over the large rice supply in Japan proper and the government has proposed to purchase about 996,689 tons of unhulled rice after November 1 and a rice acreage reduction in 1934 for Japan proper and her colonies.

#### COTTON

#### Egyptian cotton crop shows sharp increase over last year

The first official estimate of the 1933 Egyptian cotton crop is placed at 1,642,000 bales of 478 pounds, according to cabled advises from the International Institute of Agriculture. This compares with the first estimate a year ago of 869,180 bales and a final figure of 1,004,000 bales. The average production of the past five years has been 1,487,000 bales including the record crop of 1,768,000 bales in 1929. See table page 428.

The increased crop this year is largely the result of the removal of government acreage restrictions and the planting of 1,873,000 acres compared with 1,135,000 acres a year earlier.

#### CROPAND MARKET PROSPECTS, CONT'D

#### World cotton carry-over on July 31 shows reduction from last year

Due to the surprisingly heavy world consumption of cotton, particularly American, during the last part of the 1932-33 season the world stocks (or the carry-over) at the end of the season were considerably less than had been expected. The record domestic consumption toward the end of the season and the increased consumption in foreign countries resulted in a world consumption of American cotton, as reported by the International Federation, of 14,167,000 bales, whereas 2 or 5 months before the end of the season many expected that world consumption would be only slightly above 13,500,000 bales.

The total world carry-over of American cotton on July 31, this year, emounted to 11,597,000 running bales, which is 1,364,000 bales less than a year carlier but was still more than twice as large as the average during the 10 years, 1922 to 1931, and the second largest on record. The greatest decrease in the stocks of American occurred in the stocks in public storage and at compresses in the United States where there was a decline from a year earlier of almost 1,000,000 bales. Cotton stocks "elsewhere" in the United States, which includes cotton on farms; on shipboard for export but not cleared; cotton coastwise; and cotton in transit, were almost 700,000 bales below those of a year earlier. Stocks at ports and affoat for Europe, however, were considerably larger than at the end of July last year.

Stocks of Indian cotton at specified locations, not including stocks in the interior of India, showed an increase over last year's small stocks of 865,000 running bules. Unfortunately it is impossible to get stocks in the interior of any of the producing countries other than the United States. If the size of the stocks of potton in the interior of India were known or, in other mords, if data on the total carry-ever of Indian were available it is probable that they would show variations from year to year considerably different from those shown by the stocks at specified locations. However, in the absence of complete stocks figures, the stocks at specified localities are used as the carry-over for the purpose of roughly determining the variations in supplies. While stocks of Indian were much larger than at the beginning of last season they were only slightly larger than at the end of July 1931, and were smaller than the 3 years prior to 1931. The increase in the carry-over of Indian cotton this year is accounted for by the increase in the 1932-33 crop and a decrease in the world consumption of that cotton.

Stocks of Egyptian cotton on July 31 this year, were about 250,000 bales less than a year earlier and the smallest since 1929. The Egyptian crop in 1932-33, it will be remembered, was the smallest since 1921-22. Due to the larger Chinese crop, the carry-over of sundries cottons increased somewhat despite a 19 per cent increase in the world consumption of sundries.

The total world carry-over of all cotton on July 31 in running bales amounted to 16,444,000 bales compared with 17,086,000 bales a year ago and 13,905,000 bales two years ago. Prior to last year the largest stocks of all cotton on record were those of 1921 when the total amounted to 14,159,000 bales. See table, page 428.

#### CROPAND MARKET PROSPECTS, CONT'D

#### LIVESTOCK, MEAT AND WOOL

#### Denmark expected to agree to British pork quotas

No definite agreements have been reached as yet between the British government and the emporting countries as to further reductions in the cured pork import quotas which were scheduled to become effective September 15. Reports indicated that during the last half of September most of the countries were shipping bacen and ham in about the volume agreed to prior to September 15. Cabled advices of October 2 from Agricultural Attache Foley at London, however, state that during the month of October, Denmark, the most important exporting country, probably will agree to ship bacon on the basis of the reduced quota. According to the terms of this proposed reduction, the total monthly quota of bacon and ham imports into the United Kingdom would be about 12 per cent less than the quota prevailing before September 15. The monthly quota of bacon and ham imports provailing prior to September 15 was about 82,000,000 pounds, of which about 6,900,000 pounds were alloted to the United States. The import quota which will prevail after November 1 has not yet been determined.

#### Drought causes material decrease in sheep numbers in South Africa

The severe drought in South Africa reduced sheep numbers more than five million head during the year ending June 30. About half of the decrease in numbers applies to wooled sheep which carries the total number below any previous year since 1929. The decrease in numbers of non-wooled sheep is relatively more severe since it reduces their number to less than half that of a year ago. The production of wool next year is thus expected to reflect not only the decrease in numbers of wooled sheep but the decrease in numbers of non-wooled sheep. The latter are largely used for mutton so that the severe reduction in mutton sheep will cause additional numbers of wooled sheep to be slaughtered for meat.

#### FRUIT, VEGETABLES AND NUTS

#### French fruit quota imports reduced

The French import quota on apples and pears for the fourth quarter of 1933 has been fixed at 12,000 metric tons (13,230 short tons) from all countries. This is a very heavy reduction from the 31,000 metric tons allowed during this period of 1932 of which the United States share was 10,155 metric tons. Press comments indicate that the French Minister of Agriculture has authority to increase the quotas by 33 per cent later in the quarter if he deems it necessary, a practice not uncommon under the quota system, but which has not as yet been officially confirmed.

#### CROPAND MARKET PROSPECTS, CONTID

Total shipments of apples to France from the United States in 1932-33 were about 1,000,000 bushels as compared with 2,000,000 the previous year. Most of the reduction was due to the quota system which is used to regulate and limit imports. Nearly all of the United States apples that gained entry into France last year sold at satisfactory prices whereas losses were sustained in many other markets. Consequently, it is reasonable to assume that had there been no quota limits imposed, shipment would have been larger. While country quota amounts have not yet been received, it is believed that the United States will be able to supply the bulk of the apples and pears entering France either by direct shipment or by reshipment under the quota of nearby countries. Even then the total takings will be less than last year.

#### Increased demand for American apples expected in Poland

Because of a short domestic apple crop, Polish demand for American apples this year is expected to exceed that of the past two seasons, according to advices from Commercial Attache Clayton Lane at Warsaw. In 1932 direct shipments of apples from the United States to Poland amounted to 87,482 boxes, valued at \$166,928, and 14,419 barrols, valued at \$72,612. During 1931 there were no shipments of apples from the United States to Poland. The Polish government is said to have decided not to establish a quota limiting the apple trade to a certain quantity and favorable settlement of the customs duty question is expected.

#### Russian agricultural exports and imports

Exports of foodstuffs and other agricultural products from Soviet Russia showed a decline for most items during the first six months of 1933 as compared with the same period of 1932. The most important exceptions are fish; caviar, canned fish and crab, flax and tow, linseed and cottonseed oil, bristles and hair, the exports of which increased in 1933. Dressed fur exports also showed a substantial increase.

Imports of foodstuffs and other agricultural products during the first six months of the current year, with minor exceptions, were likewise seriously curtailed. There was a particularly heavy slump in the formerly large imports of rice, raisins and currants, herring and hides. Wool was one of the few items the imports of which showed an increase during this period.

Exports of all the important cereals showed a heavy slump during the agricultural year 1932-33. Which ended June 30. Wheat exports, which in 1930-31 amounted to 112,000,000 bushels and were the largest in any of the years since the beginning of the World War declined to 72,000,000 in 1931-32 and 19,000,000 in 1932-33 and were thus again far below the 1909-10 and 1913-14 average of 164,000,000 bushels. A continuous decline since 1930-31 was also shown by oats, and barley. The exports of rye and corn which increased in 1931-32, also decreased in 1932-33, especially the shipments of rye. See tables on pages 421-423.

#### AGRICULTURAL EXPORTS OF THE UNITED STATES, 1932-33 a/

The value of United States exports of agricultural products, exclusive of forest products, dropped to \$588,169,000 for the year ended June 30, 1933, the lowest since 1895-96, and 22 per cent less than the small exports of the preceding year. Agricultural products made up 42 per cent of all exports from the United States, the largest percentage since 1924-25. The volume of exports was also below that of the previous year. Wheat, including flour, was the outstanding single item contributing to the decline. Cotton made up 55 per cent of the total agricultural exports, tobacco and fruits, 11 per cent each, meats and meat products, including animal fats and oils, 9 per cent, grains and grain products less than 7 per cent.

#### Cotton

Cotton exports, though less than the preceding year by a very small margin, were among the highest on record, the total amounting to 8,647,000 bales valued at \$321,960,000 as against 8,989,000 bales valued at \$337,595,000 a year ago. The distribution of the exports, however, was markedly different. Depleted stocks and increased textile activity contributed to larger takings by E ropean countries, while purchases by Oriental countries were markedly curtailed. Total exports to Europe stood at 6,275,000 bales as against 4,990,000 bales a year carlier, or 73 per cent of all the cotton exported.

Germany took 1,900,000 bales, and the United Kingdom 1,521,000 bales as compared with 1,629,000 bales and 1,333,000 bales, respectively, during 1951-32. Much of the cotton consigned to Germany, however, eventually goes to other central European countries. Exports to Japan, though loss than a year ago, amounted to 1,707,000 bales, the second largest on record, and for the third successive year exceeded the exports to the United Kingdom. Combined shipments to China and British India showed a reduction of approximately 1,000,000 bales when compared with the preceding 12 months. During 1932-33, the average export value of lint cotton was 7.4 cents per pound as compared with 12 cents and 7.5 cents per pound, respectively, during 1930-31 and 1931-32.

#### Grains

Large wheat crops in European importing countries, together with numerous trade barriers, reacted unfavorably upon United States exports of wheat and flour, and reduced the total to 41,225,000 bushels, the smallest export since 1872, and less than 1/3 the volume exported a year ago. Of this total, 9,302,000 bushels was wheat sold to Brazil under a special agreement by the Farm Board. Cuba and Grocco were the second best customers, taking 3,492,000 bushels and 3,153,000 bushels, respectively. The United States exported more barley than during 1931-32, and more corn and oats then during the two preceding years, but exports of rice were the smallest since 1925-26.

a/ Corresponding issue last year, October 3, 1932.

AGRICULTURAL EXPORTS OF THE UNITED STATES, 1932-33, CONT'D

#### Meats and meat products

Efforts on the part of Germany, the United Kingdom, and certain other European countries to restrict imports and become more self-sustaining in hog production affected United States exports of cured park adversely. Exports of hams and shoulders recorded a slight gain over the unusually small exports of a year ago, but otherwise were the smallest since 1910-11. Emports of bacon dropped to a new low level, making the total exports of cured pork 88,912,000 pounds, the lowest in over 60 years.

The bulk of the cured pork went to the United Kingdom, Cuba, Italy, and Sweden, exports to each of the last two countries exceeding the exports, to Germany. Lard, including neutral lard, recorded some increase in exports, the total amounting to 565,857,000 pounds as compared with 550,320,000 pounds during 1931-32, a gain of 3% in volume but at considerable reduction in value. Hams and shoulders had an average value of 10.0 cents per pound, and bacon 6.9 cents per pound as against 12.7 cents and 9.2 cents during the preceding 12 months.

#### Fruits

Fruits exported from the United States during 1932-33 were valued at \$65,933,000, the lowest in more than a decade, but 155 percent above the prewar level. Fresh apples made up approximately one-fourth of the value of all the fruit exported, but both boxed and barreled apple exports were below those of the preceding two years. This is largely explained by the small United States apple crop in 1932. Normally, about half of our exports go to the United Kingdom, but during the season just closed only 41% was sent to that market. Both Germany and the Netherlands increased their purchases of American apples, while exports to Canada fell off. This shift in the distribution was largely accounted for by short crops in Europe and the trade restrictions imposed by the United Kingdom and Canada.

Of the dried fruit, prunes and raisins are the most important in the export trade but along with dried apricots, peaches and pears showed a downward trend when compared with a year earlier. More dried apples were exported but at a decline in value. Reversing the general downward trend, exports of fresh pears exceeded the previous year in both quantity and value. The United Kingdom was the heaviest purchaser and there was a noticeable increase in exports to France and the Netherlands.

AGRICULTURAL EAPORTS OF THE UNITED STATES, 1932-33, CONT'D

The United States exported 238,583,000 pounds of canned fruit valued at \$15,081,000, about half of which consisted of peaches and pears. There was a strong foreign demand for canned grapefruit which increased exports from 6,649,000 pounds in 1931-32 to 14,799,000 pounds in 1932-33 and more than doubled the value. Most of this was sold in British markets.

#### Tobacco, unmanufactured

Burley and Maryland and Ohio export were the only types of leaf tobacco which recorded a gain in export volume, but all of them declined in value. All other types, including bright flue-cured, which made up 71 per cent of all the leaf exported, declined in both volume and value. The United Kingdom and China take the larger share of the bright flue-cured. European countries were the heaviest purchasers of most of the other types.

#### Oilseeds and oilseed products

Exports of peanuts amounted to 5,126,000 pounds as compared with 5,345,000 pounds a year earlier, a gain of 53 per cent, but in value the increase amounted to only 17 per cent when compared with 1951-32. Canada is our best market for this commodity. Other oilseeds exported amounted to 173,625,000 pounds as against 109,415,000 pounds during 1931-32, a gain of 59 per cent in volume but only 27 per cent in value. The volume of cottonseed oil and ecconut oil increased considerably over 1931-32 but at greatly reduced prices. Most of it goes out in the form of crude oil. Canada and Cuba are the principal outlets for cottonseed oil and most of the ecconut oil goes to Canada and Mexico. Foreign takings of all kinds of oil cake and oil-cake meal fell off materially in both volume and value.

#### Annual volume index numbers of agricultural exports, 1932-33

Expressed as an index number, United States exports of agricultural products for the year ended June 50, 1935 stood at 84, the lowest since 1909-10 and 14 points below the index a year ago. When cotton is excluded, the decline was even more pronounced, the index amounting to 63, the lowest in nearly six decades.

Cetton, fruits, and unmanufectured tobacco made the best showing last season with exports either equaling or exceeding the pre-war level, but along with all other a ricultural groups recorded a decline when compared with the preceding year. Increased takings by European countries helped to raise the cetton index to 100, the third highest index since 1914-15. The previous year it was 103.

#### AGRICULTURAL ELPORTS OF THE UNITED STATES, 1952-US, CONTID

Not since the period immediately following the Civil War has the United States exported as small a volume of grain, meats and meat products as during 1932-33. Exports of fruits with an index of 255 were much above the pre-war level but registered a decline when congared with the unusually heavy exports of other recent years. For unmanufactured tobacco the index was 102, the lowest since the close of the World War, and the index for dairy products fell to 74, the lowest in over 20 years.
